Application Examiner:

Northwest EMC Test report # IRR10001 was used to support an original grant of certification for FCC ID: 2ABSA5001 issued March 17, 2014. After the grant was issued, the TCB, Northwest EMC, Inc. determined that the test report contained data only for the lowest channel. Per 15.31(m), the lowest, middle and highest channels should have been tested

The grantee scheduled testing of their product at the middle and highest channels. It failed to meet the spurious radiated emissions limits while transmitting at high channel (455.92 MHz). The grantee then decided to modify the software on their product so that it would only transmit from 433.92 – 443.92 MHz

The original test report has been revised to include data while transmitting at the lowest (433.92 MHz) channel, and the highest (443.92 MHz) channel. Note that FCC 15.31(m) requires only the lowest and highest channels to be tested when the operating range is 1 – 10 MHz
